

known for its expertise in handling the filtration and purification needs of commercial and industrial water treatment with technologically advanced designs and optimally functioning systems. These systems can also be made available in customised specifications or configurations to suit individual requirements of output water that varies from regular household consumption to specialised industrial processes. "Ancillary equipment and systems for water supply, storage, cooling, dispensing, recycling and rain water harvesting are also part of our product offering," says Mohd. Naser Azeez, Director.

OUALITYWATERSOLUTIONS

The idea behind the startup

Topographic differences, temporal uncertainties and rapid economic growth over the last few decades have brought water-related is sues to the forefront. We face several ma jor challenges such as citizens' access to quality drinking water, increasing sa linity in groundwater supplies, reliable water sources for industrial growth and public health crises due to untreated sewage and polluted rivers. While wa ter stress is the concern at the national level, many communities and regions are already battling more serious crises.

We at Aquality (AWSPL) be lieve that innovation holds the key to growth and sustainability of any organisa tion. While high growth remains a key parameter to success but that in itself may not ensure community development and environmental replenishment. In the current socio-economic scenario where en vironment has become the priority globally, efforts are required locally to achieve growth, which benefits at a greater scale in the water sector.

We strive to create a positive impact at the community level **OFEXTREME**

Business model

with our interactions.

As an entrepreneurial firm in an era of extreme competitiveness, we move ahead by creating value rather than pursuing busi ness. This strategic choice is reflected in our approach at every step, it is something we count on to emerge as a leader.

The way forward

As innovative entrepreneurs, we would definitely be focusing on efforts to bring in sustainable solutions. This could address the needs at the ground level like our innovation, which uses renewable energy for wa ter treatment. Such products will be the future of the in

dustry that has more or less been dependent on technology developed in other countries and tends to be unsuitable for local conditions. With innovation as the core strategy, AWSPL anticipate to be at the forefront of the industry providing solutions to the most demanding needs, be it products or services.

Overseas foray

Global markets have always been a strategic goal from in cial figure ception as the water treatment industry's scope extends beyond geographical boundaries. That being said address try, the ing the international market requires resources and strengths at an extended level, something which we are on track to achieve.

Social touch

Innovative products for safe water in remote areas, awareness and information on water conservation are some of the social causes taken up and pursued by us where the impact is not measurable in units. However, employment, training, skill development and services that have a more apparent impact are some of our achievements at social level.

The paradigm shift

Businesses do normally change the way they operate when technology develops making previously unattain - able targets easily reachable. However, to withstand or evolve with drastic developments and changes in tech - nology, the organisation has to be extremely dynamic and adaptable. For the record, entrepreneurial organisations have the ability to embrace and adapt than traditional business mod - els, which have a rigid structure.

The IoT is changing the way equipment is designed to interact with users/operators while enabling realtime access and control to key parameters. This has drastically improved the performance and maintenance of water treatment equipment.

Tech disruptions

Artificial intelligence, machine learning and blockchain, which are among the latest in technological advance - ments aiding the industry can have a positive impact if

incorporated in the business model. However, imple menting and integrating these in the business require rethinking the existing processes from scratch. This may take some time but eventually these advancements hold great potential across the vertical.

Idea of wealth generation

All wealth created cannot be measured in terms of financial figures nor marketability. Even though profitability is historically the main criteria of success to assess an industry, the water treatment industry is more about fulfilling

the basic needs of existence.

For me, choosing this industry was be yond the considerations of profits. Satisfaction comes from being able to provide affordable access to safe drinking water. That being said, as an industry, water treatment has immense potential globally as products are being developed that can overcome scarcity issues by treating any kind of water for reuse multiple times.

Self realisation

As a matter of fact there has been no such single moment yet, but looking back I realise that initially the challenges and tasks were smaller in scale which have multiplied several times during the years. That operate shows that we have grown to be counted and recognized. In fact this nomination and award is one such moment. Down the line I would look at creating opportunities and supporting those who are struggling with similar challenges I faced initially.

$Message \,to\,young\,ent repreneurs$

Entrepreneurship is all about persever - ance, working hard, thinking smart, not getting killed by stress, paying attention to details without getting dis - tracted, overcoming weaknesses, focusing on core goals, sacrifice, taking along people, adapting to situations positively, embracing and learning from mistakes to name a few.

To summarise there is no single formula to being successful but it is a culmination of factors and efforts.
